

Command Center - Well Watching Operations

At Standard Directional we provide 24hr/7days a week Well Watch Services for every well we drill. Our drilling engineers watch every well with the care and attention to detail each one deserves.

How our service is different than other "Remote Drilling Applications?"

Having all rig information at your fingertips is essential to make the right drilling decisions. In return, improving efficiencies and reducing costs.

1. We are drilling our wells in town with accredited Drilling engineers and Directional Managers whom the field staff is accountable too. This gives us the chance to drill while on paper (DWOP) prevent issues before they start, increase efficiencies, decrease costs, and maximize ROP.
2. All of our MWD equipment has global access for our WITSML servers and data aggregation system. Having all rig information at your finger tips is essential to make the right drilling decision. Our clients have the comfort knowing we are interactive and always on the job.
3. Why don't we use on call coordinators for trouble shooting like our competitors? Through our risk assessment program we have proven this method to be highly inefficient in reaction time and over all service quality. Every minute counts on the rig, average reaction time for a coordinator to get him up to speed on a particular well can be up to two hours. Instead the field staff is in constant communication with our well watching team that is already up to speed. We include this service whether its a full directional staffed rig, to zero staff full remote applications.

We simply want to provide exceptional quality, attention to detail while being proactive on improving efficiencies and reducing costs.
